Summary

Software Developer at Oracle with 2+ years building and migrating enterprise banking systems in Java and Spring Boot. Revamped legacy infrastructure, transitioning **700+** J2EE services to Spring Boot, slashing API response times by **75%**, and accelerating debugging through ELK stack implementation. Rated 'Outstanding' (5/5) for performance at Oracle.

Skills

Languages: Java, JavaScript, Python, Dart, SQL, C, Shell

Frameworks: Spring Boot, Spring Security, React.js, Node.js, Express.js, Next.js, Flutter

AI/Cloud: LangChain, N8N, Agentic AI, Microsoft Azure, Docker, Kubernetes, Firebase

Databases & Monitoring: OracleDB, MongoDB, ELK Stack, Prometheus, Grafana, Zipkin

CI/CD & Tools: Jenkins, Gradle, Git, GitHub, ArgoCD, Postman, JMeter

Core: DSA, OOP, System Design, Microservices Architecture, REST APIs, Agile

Experience

Oracle

June 2023 - Present

Software Developer

Pune, India

- Designed the Oracle Banking Routing Hub architecture for HDFC Bank, delivering the full system with 0 critical defects.
- Migrated **700+ REST and SOAP services** from J2EE to Spring Boot/Java 17, using Agentic AI for automated code conversion.
- Built a RESTful API integration layer in Spring Boot connecting legacy J2EE systems with microservices for cross-application data exchange.
- Reduced API response time by **75%** through caching and parsing optimizations; cut debug time by **80%** with ELK Stack (ElasticSearch, Logstash, Kibana) monitoring.
- Implemented Role-Based Access Control (RBAC) across **15+ screens** and built CI/CD pipelines with Jenkins for automated testing and deployment.
- Achievement:** Received the highest performance rating of 'Outstanding' (5/5) at Oracle.

Projects

MyGuard - Gated Community Management Platform | Java 17, Spring Boot, Flutter, Firebase, Dart | [GitHub](#)

- Architected a full-stack gated community platform with a **Spring Boot** monolith and **Flutter** cross-platform app, using **Firestore** (Auth + Firestore) for real-time data sync and authentication across 3 user roles (Residents, Guards, Admins).
- Enforced **role-based access control** via Firebase ID token verification in a Spring Security **OncePerRequestFilter** with **@PreAuthorize**, following a strict layered MVC architecture (Controller → Service → Repository) with interface-driven dependency injection.
- Built **10+ feature modules** – visitor approval with QR codes, guard patrolling, amenity booking, maintenance billing, helpdesk with SLA-based escalation, and parking management – with role-specific Flutter dashboards and real-time push notifications.
- Designed async Firestore data access using **ApiFuture/CompletableFuture** for non-blocking reads/writes, with paginated queries and a global **@ControllerAdvice** exception handler returning standardized **ApiResponse<T>** responses.
- Developed an offline-capable **Flutter guard interface** with multilingual support, and integrated a **payment gateway** for automated society maintenance dues collection and reconciliation.

MyKart - E-Commerce Microservices Platform | Java 17, Spring Boot, React 18, MongoDB, Docker, Azure | [GitHub](#)

- Designed a **7-microservice** e-commerce platform (User, Seller, Product, Cart/Wishlist/Orders, Config, Eureka, Gateway) with Spring Boot 3.3 and MongoDB, featuring **Spring Cloud Gateway** JWT auth and **Netflix Eureka** load-balanced routing.
- Added **Redis caching** on product-catalog queries to reduce database load, and a **Spring Cloud Config** server backed by MongoDB for externalized configuration across all services.
- Built a **React 18 SPA** with Context API auth, centralized Axios interceptors for JWT injection, and responsive product browsing, cart, wishlist, and search features.
- Implemented a global JWT filter that validates Bearer tokens and propagates **X-User-Id** headers to downstream services, enabling stateless user-context across the entire microservice mesh.
- Containerized all services with **Docker** and deployed to **Azure**, with per-service health checks, centralized logging, and environment-based profile configuration.

N.O.V.A - Neural Operative Virtual Assistant | Python, FastAPI, Azure, PyQt6, OpenCV, SpeechRecognition | [GitHub](#)

- Built a full-stack AI assistant with a **FastAPI** backend and dual interface – a **PyQt6** desktop GUI with 3D visualization and a voice client with wake word detection.
- Implemented **Azure GPT-4o** tool-calling integration that autonomously selects and executes from **13+ registered skills** (file I/O, system monitoring, camera, weather API, browser automation).
- Created a decorator-based **plugin architecture** with hot-loadable skills, **OpenCV** camera feed with HUD overlay, real-time speech-to-text/TTS, and a live statistics dashboard.
- Engineered a real-time **speech-to-text/TTS pipeline** with continuous listening mode and wake word activation, enabling hands-free conversational interaction with the assistant.
- Built a live **statistics dashboard** tracking response latency, token usage, uptime, and system resource metrics with auto-refreshing visualizations in the PyQt6 interface.
